Block bootstrapping

A real example

The holy grail of stochastic reserving techniques is to obtain a predictive distribution of outstanding liabilities.

One method that has been proposed to produce a simulated predictive distribution is Bootstrapping.

bootstrappin

- Bootstrapping ODP Model
 - ODP model
 - Bootstrapping ODP model
 - A practical problem

A real example

ODP model assumption(Renshaw & Verall, 1998)

 $X_{i,j}$, incremental payments.

$$X_{i,j} \sim ODP(m_{i,j}, \phi_j)$$

 $E[X_{i,j}] = m_{i,j} = x_i * y_i$

$$E[X_{i,j}] = m_{i,j} = x_i * y_j$$

$$Var[X_{i,j}] = \phi_j * m_{i,j}$$

$$\log(m_{i,j}) = c + \alpha_i + \beta_j.$$

Block bootstrapping

- Step of bootstrapping ODP model(England & Verall, 1999, 2002, 2006).
 - f I Fit the model and obtain fitted values \hat{m}_{ij}
 - Calculate the residuals

$$r_{i,j}=\frac{X_{ij}-\hat{m}_{i,j}}{\sqrt{\phi_j\hat{m}_{ij}}}.$$

- \blacksquare Resample residual r_{ij}^*
- Obtain pseudo data

$$X_{ij}^* = r_{ij}^* \sqrt{\phi_j \hat{m}_{ij}} + \hat{m}_{ij}.$$

- 5 Refit ODP model to estimate the future incremental payments
- Simulate forecast incremental payments from process distribution
- Repeate many times and store the simulated forecast payment
